Quick How-To for Xcode 4

Xcode can be used for this class. Installing it is quite simple. Below you will find steps on how to do that and then a quick example about creating a console application.

Installing
This is quite simple.
1. Open the “App Store”
2. Search for Xcode as seen below
3. Click install

Creating a Console App
1. Open Xcode
2. Click “Create a new Xcode project
3. Navigate to “Application” under the OS X banner, click on “Command Line Tool” and then click Next

![Image of Choose a template for your new project]

4. Name your project and be sure to select “C” under Type and then click next

![Image of Choose options for your new project]

5. Choose a folder to store the project in and click “Create”. I like to store my stuff on dropbox. This provides a good way to backup your stuff. [http://www.dropbox.com](http://www.dropbox.com).
6. To edit your code file navigate to the main.c file on the left side of the interface.
7. To test this, click Run. The output from your program is seen on the bottom right under “All Output” as seen below.
